DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 3, 4, and 5 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

3. It is unclear in claims 3, 4 and 5 if the applicants are actually claiming a composition or if the other materials listed are for setting forth test methods.

4. The examiner notes that the applicant's use of the term "calorie" appears to be idiomatic. It appears that the correct word may be "enthalpy".

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1-7 are rejected under 35 U.S.C. 102(b) as being anticipated by JP-08-157791 or JP-08-311419.

7. For the purpose of examination, the examiner takes the position that the applicants are claiming a two layer system, in which the adhesive layer does not require a blend (see above).

8. Each of the Japanese patents are directed to a film comprising a pressure sensitive ethylene / alpha olefin polymeric layer and a substrate layer. The ethylene / alpha-olefin layer has good adhesive properties is made using a metallocene catalyst. Each does have Mw/Mn distributions within the claimed range. It appears that these materials have some degree of crystallinity so would have phase change (a calorie change of greater than 1 J/g) and are solids at room temperature so would have a melting point (a calorie input of greater than 1 J/g) as claimed. The examiner takes the position that the catalyst system used to make the materials coupled with the way the polymers are described as being adhesive at low temperatures would support the contention that the material would behave as claimed.
